Dear Bavarian Capital Hiring Team,

I'm excited to apply for the Junior AI Automation Developer role. I've spent the last few years building AI systems that actually ship, and I believe I can bring real value to Bavarian Capital's automation efforts from day one.

At Virginia Tech, I designed and deployed an intelligent search platform using LLMs and RAG pipelines that automatically retrieved technical assets across thousands of documents, diagrams, and voice recordings. At James Madison University, I built the perception and control system for an autonomous vehicle with YOLOv8 and ROS 2, achieving under 100 milliseconds of latency. These were deployed systems that people used, not research experiments.

Beyond the AI itself, I care about the infrastructure that makes automation reliable. FastAPI, PostgreSQL, Docker, CI/CD. Good automation is invisible. It just works. I make sure nothing breaks.

I also thrive under pressure. I've trained as a 3rd Dan Black Belt in Taekwondo for 15 years and competed for the Egyptian National Team, earning 43 international medals. The lesson is simple: consistency beats intensity. Whether I'm optimizing a pipeline or debugging a production issue, I measure, I iterate, and I deliver.

I'm drawn to Bavarian Capital because I want to apply AI where it creates real operational efficiency, not just academic papers. I'm available immediately, fully remote, with a dedicated home office ready to go.

Thank you for your consideration.

Best regards,

Ahmed Badr
